

Softwood Timber Processing

There is an opportunity to finance a lucrative softwood processing venture based in the Manicaland province of the country. This is largely an import substitution project where currently imported materials for furniture will be locally produced from the abundant softwood plantations in the Eastern Highlands part of the country. The project is also part of the re-industrialisation efforts in the economy where previously abandoned ventures due to inability to retool at the time are now being revived.

The project involves the production of fiberboard & related value added products for which there is a market locally, regionally and globally. The business plan is anchored on leveraging on existing fibreboard infrastructure and competitive manufacturing and product delivery capabilities in panel board products gained over the past 25 years. A suitable financing partner is required for the project.
